

Rubberwood Furniture

Rubber trees are initially planted for their sap and stop producing sap after 15 to 20 years. In the past, the unproductive trees are cut down and discarded in large quantities. Today, these trees are given a new life by making them into a material for furniture.

About 1,280 liters of sap can be collected from each rubber tree. Sap collected is used in production of tires, latex, gloves, boots, etc.

Square lumbers are joined by finger joint processing before being laminated. Small holes are covered to provide a smooth finishing before shipping out to the furniture factory.

Natural material from Asia - Rubberwood

Dong Nai Province, Vietnam

Sap into rubber, old trees into furniture

The white sap that runs through the trunk becomes a raw material for rubber and latex, supporting production all over the world. Rubberwood is a broad-leaf tree that grows in South America and Southeast Asia. Dong Nai province, central of Vietnam, has plantations with more than 100 million trees in total. There are 30 plots in the plantation, and by cutting down and replanting one plot each year, a sustainable tree planting system has been built. Trees that no longer produce sap are usually discarded in large quantities, but in recent years they are widely used for furniture and building materials due to their smooth texture and hard wood quality. The reason why MUJI has its focus on rubberwood, is not only because of its high quality, but also by having the raw material production area nearer to the furniture factory, it will help to reduce transportation costs and carbon dioxide emission. In addition, we are able to secure a stable supply of raw materials. Thin and long trees have many knots and lack strength if they are used as it is, so they are made into short square lumber, and while sorting out knots and colour unevenness, they are then made into a single board. Each piece of rubberwood furniture is unique with its own character and distinct wood grain, making it one of a kind in the world.
